

Scientometric research in South Africa and successful policy instruments

Prof Anastassios Pouris,

*Director: Institute for Technological Innovation, University of Pretoria
email: anastassios.pouris@up.ac.za*

Abstract

This document provides an analysis of scientometric research in South Africa and it discusses sources of growth in the country's research literature in general. South Africa is identified to have limited expertise in the field revealed mainly during the last decade. However, the country is ranked 21ST in the world among the countries publishing in the journal *Scientometrics* and it is the only African country with such a standing in the field. Identification of the forces affecting positively the growth in the number of research publications in the country indicates that the primary incentive fuelling the recent growth is the new funding formula in the country which subsidizes the universities by more than R100 000 for each publication that their staff produces. The increase in the number of journals indexed in the ISI Thomson Reuters database and the incorporation of social sciences at the NRF have also affected the growth of research publications, but to a lesser extent.

Key words

Scientometrics; South Africa; incentives; impact on research

Introduction

Since Vassily V. Nalimov coined the Russian term 'scientometrics' ('naukometriya') (Nalimov and Mulchenko, 1969), the term has grown to define research in quantitative aspects of science and technology. The term had gained recognition by the founding in 1978 of the journal *Scientometrics* by Tibor Braun in Hungary. Even though scientometric studies are not without their critics (Roland 2007; Leydesdorff 2008) scientometrics is currently an indispensable part of science and technology policy monitoring and assessment studies (Jeenah *et al* 2008); studies related to the structure and dynamics of science (Schubert *et al* 2010; Mackenzie 2000, Mansfield 1995); impact assessments (King 2004; Lubango *et al* 2009; Inglesi-Lotz *et al* forthcoming) and others.

In South Africa the first scientometric investigations were undertaken during the second half of the 1980s. The term was unknown to policy makers at the time. Twenty years later, researchers publish in the field and government authorities commission relevant research and use scientometrics for the development of science and technology indicators (NACI 2002).

The objective of this document is to describe the growth of scientometrics research in the country and discuss the recent rapid growth in the country's number of publications.

Methodology

For the objective of this investigation we use scientometrics firstly in order to observe the state of scientometrics research in the country at the particular level of specialization, and secondly in order to identify the factors affecting the country's overall research output.

The Institute for Scientific Information (ISI) Thomson Reuters family of databases (citation indices) is commonly used as information platform for these types of analyses and assessments and is utilized for this investigation.

The ISI databases are particularly useful in the South Africa context as the Department of Education has identified the ISI indexed journals for subsidy purposes and universities provide incentives to their researchers to publish in ISI indexed journals.

The identified platform is interrogated for the identification of South African authors publishing in the field of scientometrics. Scientometrics articles have been identified

according to a number of key words and articles published in a relevant set of journals. The set of journals – those most related to the journal *Scientometrics* - is as follows: *Scientometrics*; *Journal of Informetrics*; *Research Evaluation*; *Annual Review of Information Science and Technology*; *Journal of the American Society for Information Science and Technology*; *Journal of Information Science*; *Journal of Documentation*; *Information Processing & Management and Research Policy*.

The key words used were: scientometric*, bibliometric*, “citation analysis*”, “citation performance*”, “citation assessment*”, “patent* analysis”; “patent* performance”; patent* activit*”; “article* analysis”; “publication* performance”; publication* analysis”; publication* activit*; technol* performance”; “scien* quantitative assessment”; “assess* scien*”; “scientific productivity*”; “impact factor”; research and mapping; “journal assess*”; “journal evaluat*”; “research performance*”, where the * denotes a variable string of characters.

These key words cover areas of citations studies and research performance analysis, library information science and information retrieval (Uzun 2002)

The identified set of scientometric related articles was analyzed in order to identify trends over time, institutions participating in the research, and similar.

Similarly we identified all articles with at least one South African address for the period 2001-2011 in the journal *Scientometrics* and we analyzed the identified set.

Finally, we identified the country’s number of research publications and world share for the period 1981 to 2009 and reviewed the policy instruments that may have affected the country’s relevant productivity.

The results appear in the next section.

Scientometrics Research in South Africa

In South Africa the first scientometrics study was produced in 1987 on contract for the Foundation for Research Development (FRD) now the National Research Foundation (NRF).

The report (Pouris *et al* 1987) addressed the question: Is research in the field of physics good and research in the field of plant sciences unsatisfactory in South Africa?

A large-scale peer evaluation of researchers initiated by the FRD at the time indicated that physicists in the country had higher evaluation ratings and plant scientists’ lower evaluation ratings than those in other disciplines.

Based on the intuitive assumption that scientists are assessed according to their research activity and performance, the results of the FRD assessment led to the argument that: physics research was stronger than plant sciences research in the country.

The report utilised scientometrics in order to assess that assertion. The indicators used included the South African contribution to world scientific literature in the particular disciplines, the country’s rating according to publication output per discipline and the citations per paper for South Africa in the given fields in comparison to the world norms. The National Science Foundation’s (NSF) *Science Literature Indicators Database* compiled by Computer Horizon Inc Research was used for the scientometric analysis.

Contrary to the beliefs at the time the report provided evidence that botany research was much stronger than physics in South Africa.

The word scientometric was also appeared in the FRD’s structure as during 1989 the organisation established the “Scientometric Advisory Service” in order to receive relevant science policy advice.

Figure 1 shows the number of South African publications in the field of scientometrics. It is apparent that only in the mid-2000 the field started receiving attention and support. Since 1985 the field was producing only one or two publications per year. During 2009, 17 publications were published with at least one author from South Africa.

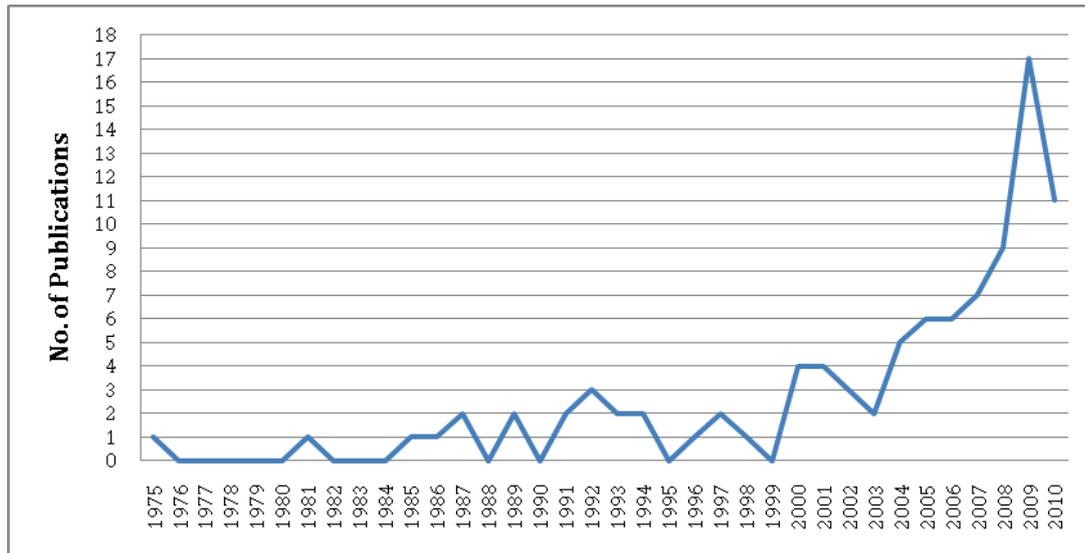

Figure 1: SA Scientometrics Publications 1975-2010

Most of the articles appeared in the journal *Scientometrics* (28) and the *South African Journal of Science* (12) (Table 1)

Table 1: Journals publishing most SA scientometrics related articles

Journal	Articles
Scientometrics	28
South African Journal of Science	12
Journal of Information Science	7
Journal of the American Society for Information Science and Technology	7
Information Processing & Management	6
Research Policy	4

Table 2: Producers of Scientometric Research in South Africa

	Articles	%
University of Pretoria	38	0.39
University of Kwa-Zulu Natal	12	0.13
University of Witwatersrand	9	0.09
Stellenbosch University	8	0.08
University of Cape Town	7	0.07
University of South Africa	6	0.06
National Research Foundation	6	0.06
Other	12	0.12

Table 2 and Figure 2 show the South African institutions which publish scientometric related research articles. The University of Pretoria appears to have produced 39% of the country’s relevant research. The University of KwaZulu Natal follows with 12%.

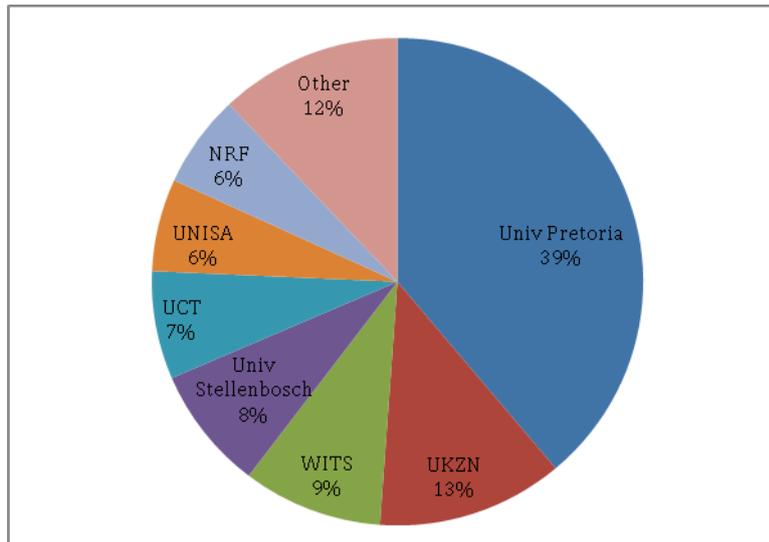

Figure 2: Producers of SA Scientometrics Research

Co-authorship analysis identified that out of the 98 articles 26 were co-authored with at least one author from another country. Eleven articles were co-authored with authors from the USA and four with authors from the Netherlands.

Table 3 shows that South Africa ranks 21st in the world according to the number of publications in the core journal of the field scientometrics. This is substantially higher from the 37th position that South Africa occupies according to total number of publications in the National Science Indicators database of ISI Thomson Reuters (2004-2008). The table further shows that no other African country is publishing in the journal *Scientometrics*. Our original list indicates that during the period investigated Nigeria and Egypt appeared with only one publication each.

Table 3: Country Ranking according to Number of publications in the journal *Scientometrics* (2001 to March 2011)

Rank	Country	No of publications	Rank	Country	No of publications
1	USA	194	16	BRAZIL	34
2	BELGIUM	152	17	FINLAND	31
3	SPAIN	141	18	JAPAN	31
4	PEOPLES R CHINA	122	19	SWEDEN	30
5	NETHERLANDS	107	20	SWITZERLAND	26
6	ENGLAND	106	21	SOUTH AFRICA	22
7	GERMANY	93	22	DENMARK	21
8	HUNGARY	87	23	IRAN	19
9	INDIA	74	24	ISRAEL	19
10	TAIWAN	61	25	AUSTRIA	16
11	FRANCE	47	26	RUSSIA	14
12	SOUTH KOREA	40	27	TURKEY	14
13	AUSTRALIA	39	28	MEXICO	12
14	CANADA	39	29	CROATIA	11
15	ITALY	39	30	NORWAY	11

Successful Policy Instruments

The introduction in scientometrics in the country not only has emphasised the importance of quantitative studies of science and technology for policy objectives but also has contributed in the setting of national targets and in using quantitative measures for subsidy purposes. Currently the country's universities receive subsidies (among others) according to the number of articles they produce annually.

Figure 3 shows the number of publications and the country's share in the ISI Thomson Reuters citation indices for the period 1981-2009 (National Science Indicators). It is noticeable the rapid increase of the country's publications from around 4 000 per year in the early 2000 to 7 000 publications in the end of the decade. Similarly the country's share in the world literature increased from 0.5% in the late 90s and early 2000s to 0.6 in the end of the decade.

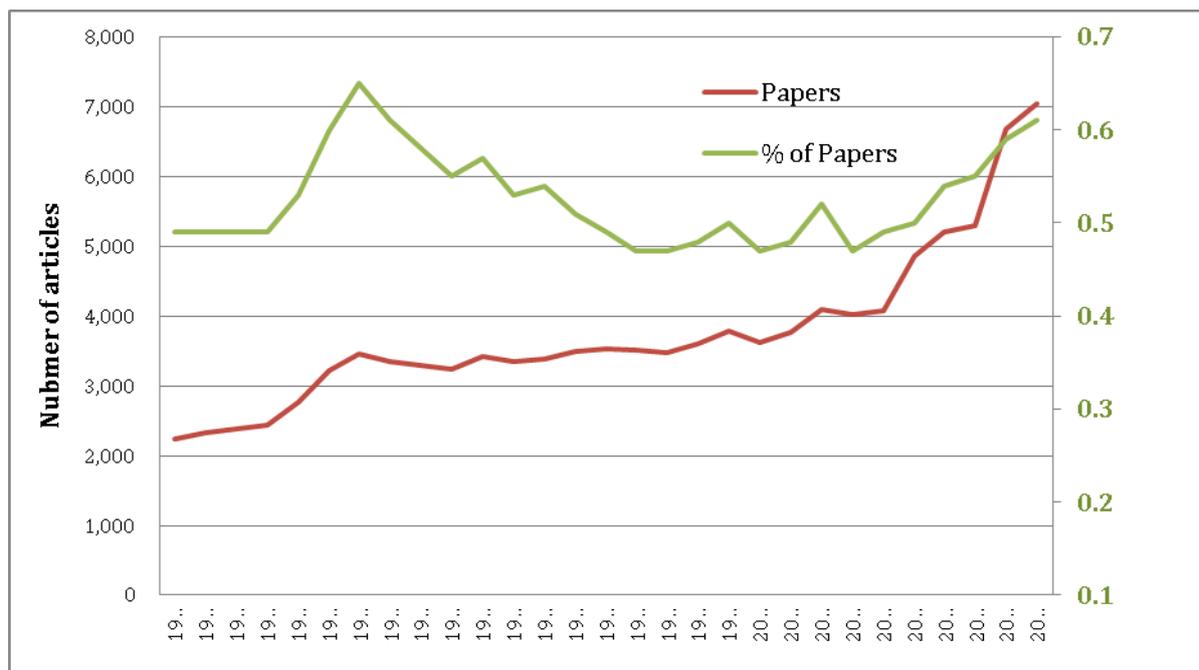

Figure3: Number and World share of South African publications (all disciplines)

From a policy perspective it is important to identify the forces that led to the substantial increase in the number of country's publications during the last decade.

Kahn (2011) investigating the country's publications for two periods (1990-1994 and 2004-2008) suggests that the growth during the period is the result of a multiplicity of factors. He states "there are greater rewards for publishing; there is a shift toward health science fields with high publication rates, there are more South African journals indexed by the Web of Science in which to publish, there may be more PhD students available to assist with research and the system is more open for co-publication with foreign parties". Furthermore, he speculates that collaboration is the most important factor affecting the growth in the number of articles in the country. However, the collaboration argument cannot explain the radical increase in the number of publications after 2004 (Fig 3). International collaboration increased from 7.9% of the total number of SA articles in 1980 to 47.2% during 2010. However, most of the growth took place during 1995-2000 and 1990-1995 (Fig 4).

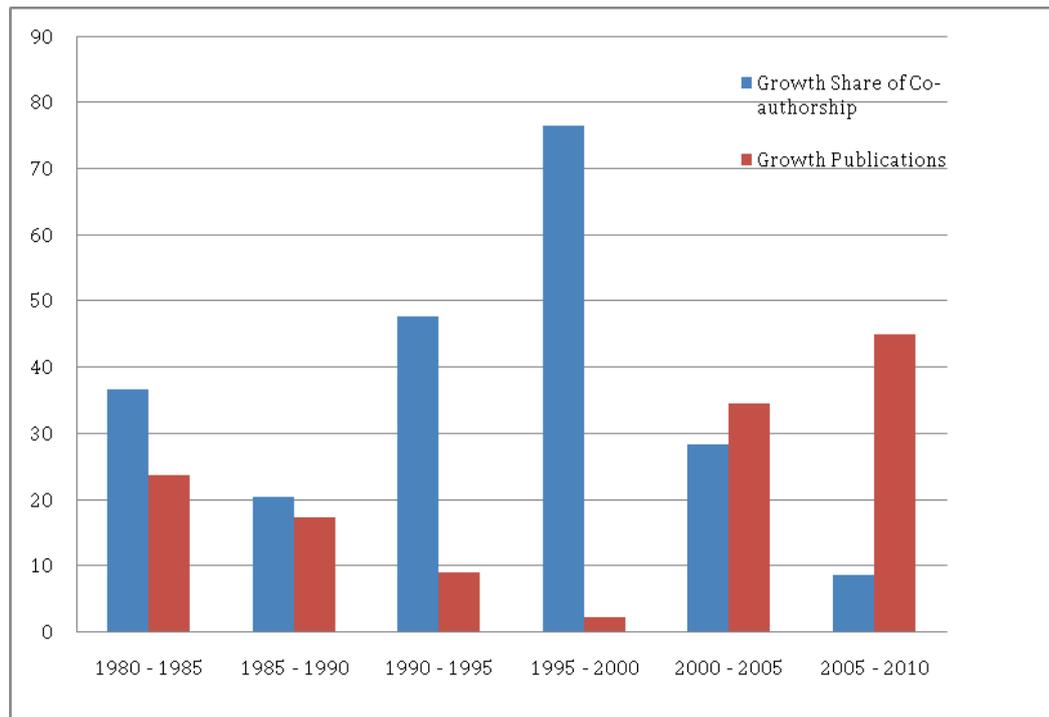

Figure 4: Growth in share of SA co-authorship articles and number of publications

Inglesi-Lots *et al* (forthcoming) used the “before/after control impact (BACI) method” in order to identify the impact of the NRF researcher rating system on the social sciences publications in the country. The authors identified that the number of social sciences’ publications were increased by 24.7% after 2001 because of the NRF’s intervention. While the authors explain the increase of articles in the social sciences it should be mentioned that the discipline was contributing only 10.6% of the country’s publications (2008).

An estimation of the number of South African articles published in the journals added in the databases during 2008 (700 additional journals) by ISI-Thomson Reuters indicates that this is only approximately 450 articles per year.

Similarly (out of the 22 scientific disciplines in the National Science Indicators database) clinical medicine and plant and animal sciences contributed 16% of the country’s articles each (2004-08) and the increase in the number of those articles contributed 26% (780 articles) of the extra 3 000 articles in the period 2003-2008. The remaining number of articles was due to increases across all scientific disciplines.

The across the board increases in the number of publications indicates that the increases were the result of a factor which was introduced during the early 2000s and was affecting all scientific disciplines. The obvious intervention was the new funding framework (NFF) for higher education institutions. The NFF for higher education institutions was published in terms of the *Higher Education Act*, No. 101 of 1997, in the Government Gazette (No. 1791) on 9 December 2003 and was implemented in the 2004/05 financial year.

The NFF supports financially the higher education institutions (among others) according to their research outputs (number of publications and number of post-graduates) (Steyn *et al* 2007). It becomes apparent that the particular policy instrument is bringing the desirable effect – an increase in the number of the country’s publications.

Discussion

This document provides analysis of scientometric research in South Africa and it discusses sources of growth in the country’s research literature. Scientometrics related research appeared sporadically in the relevant literature up to 2000. Since then the field appears to

have taken off with 17 articles having appeared during 2009. The universities of Pretoria and of KwaZulu Natal appear to be the main producers of relevant literature with the universities of the Witwatersrand, Stellenbosch and Cape Town following with small differences in their publication profiles. The *International Journal of Scientometrics* and the *South African Journal of Science* appear to be the main vehicles for reporting research results in the field from South Africa. Analysis of the corporate addresses of the authors in the journal *Scientometrics* during the last decade indicates that South Africa is ranked 21st in the world. This is a substantially higher ranking than the 37th position that the country occupies according to the total number of publications in the ISI Thomson Reuters databases. Furthermore it is identified that rarely other African countries publish in the core journal of the field – i.e. in the *International Journal of Scientometrics*.

The growth in the number of publications in the field of scientometrics is not an isolated phenomenon. All South African scientific disciplines grew substantially during the period. The number of South African publications increased from 4 000 per year during 2003 to just above 7 000 during 2009 (Fig 5). An analysis of the various factors affecting the number of publications indicates that the primary incentive fuelling the recent growth is the NFF which subsidizes the universities by more than R100 000 for each publication that their staff produces. The increase in the journal coverage of the ISI Thomson Reuters has also contributed in the increase of the publications but to a lesser extent. Similarly the incorporation of social sciences in the NRF stable of funding disciplines has influenced the publication profile of the field. International collaboration may have contributed in the gradual increase of the number of publications during the 1990' after the political sanctions were lifted.
